## Autobiographical Sketch

My name is Kathryn Kobe. I am the Director of Price, Wage and Productivity Analysis for Economic Consulting Services, LLC (ECS), a position I have held since October 2003. ECS is an economic consulting company based in Washington DC that has been in business for more than 25 years. Prior to joining ECS, I was Vice President and Chief Economist of Joel Popkin and Company (JPC), also a Washington DC-based economic consulting firm. I worked for JPC for more than 20 years. Prior to working for JPC, I was an economist for the Department of Agriculture and a research assistant for Evans Economics. I graduated *summa cum laude* with a bachelor's degree in economics from the University of Maryland and have a master's degree in economics from the George Washington University.

My areas of research include the forecasting of wage and price trends, both national and company specific. For more than 20 years I have been the principal researcher and co-author for JPC's economic newsletter *The CPI's Future*. I have analyzed Postal finances for more than 20 years and have analyzed postal rate cases and provided economic consultation and advice on postal rate matters for approximately 10 years. I have prepared price trends and analyses for telephone rate proceedings.

I also have done research relating to the state of manufacturing and manufacturing R&D in the United States and recently co-authored a white paper

1 published by the National Association of Manufacturers.<sup>1</sup> I have also researched  
2 several aspects of the economics of small businesses including the calculation of  
3 the costs of employee benefits to large and small businesses and the share of  
4 GDP attributable to small businesses.

5 I have not testified before the Postal Rate Commission prior to this  
6 proceeding. I have testified in arbitration cases related to the Postal Service and  
7 have provided expert opinions in litigation.

<sup>1</sup> “U.S. Manufacturing Innovation at Risk,” by J. Popkin and K. Kobe published by The Council of Manufacturing Associations and The Manufacturing Institute of the National Association of Manufacturers, February 2006.

1 **I. Purpose and Scope**

2 The purpose of this testimony is to calculate First Class letter rates using  
3 the concept and general methodology that has been used by the Postal Service  
4 and the Postal Rate Commission for many years. Mr. Taufique describes that  
5 concept in his testimony.

6 Since classification reform in Docket No. MC95-1, the structure of  
7 and approach to the relationship between the Single-Piece and  
8 Workshare rate categories in First-Class Mail have remained  
9 relatively constant. Workshare rates are determined by applying  
10 discounts to Single-Piece rates. These rate differentials (discounts)  
11 are based on estimates of costs avoided through each type of  
12 worksharing activity (e.g. prebarcoding and/or various levels of  
13 presortation). The cost differentials are developed by estimating  
14 avoidance of postal mail processing and related operations costs in  
15 comparison to a representative benchmark for workshare mail  
16 generally.<sup>2</sup>

17  
18 In calculating costs avoided, the bulk metered mail letter (BMM) will be used as  
19 the benchmark piece, as it has been since R97-1.

20 In this testimony I will present the critical information the Postal Service  
21 omitted from its calculations in the current docket--the costs associated with the  
22 First Class benchmark letter and the unit cost savings between that benchmark  
23 letter and each of the First Class Presort letter categories. I will then present  
24 rates that could result if discounts equal to those costs avoided were used to  
25 determine the First Class Presort letter rates, and present an alternative set of  
26 First Class rates for the consideration of the Commission in this proceeding.

27 Library References APWU-LR-1 and APWU-LR-2 are also submitted to show the  
28 calculations made.

---

<sup>2</sup> USPS T-32, p. 12.

1 **II. Background**

2 In the instant proceeding the Postal Service has proposed de-linking the  
3 rates of Presort First Class letters from those of Single Piece First Class letters.

4 Mr. Taufique, the Postal Service’s First Class rate design witness, states

5 [t]he Postal Service de-links the cost and rate development for  
6 Single-Piece Letters from the cost and rate development for Presort  
7 Letters. Accordingly, the Postal Service proposes that the rates for  
8 Single-Piece Letters and for Presort Letters be developed  
9 independently of each other. No longer should the rates for Presort  
10 Letters look to the cost base of Single-Piece Letters...<sup>3</sup>  
11

12 Mr. Taufique has proposed a change in rate design methodology. This  
13 change, if accepted by the Commission, would change the policies of the Postal  
14 Service and the Commission. It would also change the rate relationships  
15 between Single Piece First Class letters and Presort First Class letters and would  
16 create a template for further change. In stating that the Presort letter rates would  
17 no longer look to the cost base of Single Piece letters, the Postal Service is  
18 deaveraging Presort letters and Single Piece letters. From the inception of First  
19 Class workshare discounts, there has been an understanding by both the Postal  
20 Service and the Commission that discounts must be justified by costs avoided so  
21 that similar letters being provided First Class service bear the same amount of  
22 the institutional costs of the Postal network.<sup>4</sup> The process is to set a single  
23 uniform rate for First Class letters and validate discounts provided to Presort

---

<sup>3</sup> USPS-T-32, p. 15 at 5-10.

<sup>4</sup> On page 16 of its *Opinion and Recommended Decision* for MC73-1, the Commission states “Although the Postal Service admits to lack of experience with presorting, their best information suggests that the one-cent discount will, on the average, be the equivalent of the clearly capturable cost avoidance[ footnote omitted]. Thus contributions to institutional costs will be maintained.”

1 letters by the determining cost savings due to worksharing activities that allow  
2 the Postal Service to skip certain steps in processing that mail. The costs  
3 associated with the wide array of characteristics in the First Class mail stream  
4 have been averaged among all the First Class letter mailers because everything  
5 has been tied back to the overall Single Piece first ounce rate.

6 The Postal Service and the PRC adopted this concept explicitly in the  
7 choice of BMM as the benchmark piece. In its R97-1 decision, the Commission  
8 states that it “accepts the Service’s proposed use of BMM as the benchmark for  
9 calculating First-Class worksharing discounts. Fronk’s use of BMM responds to  
10 the Commission’s concern that the current benchmark—all nonpresorted single-  
11 piece mail—captures more costs than warranted.” It then quotes witness Fronk’s  
12 testimony:

13 [n]onpresorted mail includes everything from ‘clean’ mail (uniform  
14 pieces featuring typewritten or pre-printed addresses and often  
15 mailed in bulk) to ‘dirty’ mail (pieces featuring handwritten and  
16 incorrect or incomplete addresses) and all the mail in between.  
17 Using all nonpresort letters as a benchmark results in a larger  
18 discount than using a benchmark which tends to have all the  
19 attributes of presort/automated mail, except for the actual  
20 presortation or application of the barcode.<sup>5</sup>  
21

22 In the instant docket the Postal Service seems to be moving back  
23 toward the concept that was rejected in R97-1 and in doing so produces  
24 the larger discounts predicted by Mr. Fronk. Mr. Taufique states that the  
25 Postal Service’s objective is to move toward a new rate design paradigm  
26 without conceding any of the past differences of opinion on the subject of

---

<sup>5</sup> *Opinion and Recommended Decision* R97-1, p.292 at 5092.

1 workshare cost differentials. However, the Postal Service has failed to  
2 provide any convincing rationale for this change in methodology or for the  
3 change in its policies on cost averaging.

4 On average, standard-sized, typed business mail is, and always  
5 has been, some of the cheapest for the Postal Service to handle because  
6 of its “cleaner” characteristics. Consequently it tends to provide a larger  
7 contribution to overhead than does the average First Class piece. A very  
8 large percentage of business mail also has discounts associated with it  
9 that have been justified by cost savings due to the presorting and  
10 prebarcoding mailers do that reduce the number of mail processing steps  
11 the Postal Service must provide. However, there are equally clean pieces  
12 of Single-Piece mail that also provide a larger than average contribution to  
13 overhead. Those pieces pay the full Single Piece rates because their  
14 mailers do not or can not presort or prebarcode their mail. The First Class  
15 bulk metered mail letter is chosen as the benchmark because it is most  
16 like the workshared piece in its general characteristics. Thus, the Postal  
17 Service’s cost savings due to the worksharing activities are more clearly  
18 isolated because the comparison is being made between mail pieces that  
19 have very similar characteristics. The discounts based on those cost  
20 avoided savings mean that both mailers provide the same per piece  
21 contribution to overhead. Both of these mailers of “cleaner” mail also  
22 cover some of the costs of the First Class letters that have “less clean”  
23 characteristics. Differences in per unit costs based on a difference in the

1 total CRA costs for Presort mail and Single Piece mail may reflect a whole  
2 range of characteristics that do not relate to the cost avoidances for  
3 workshare activities. Thus, the proposed methodology, which essentially  
4 applies equal contributions to the straight CRA costs, would result in the  
5 mailer of the Single Piece “clean” letter paying a larger contribution to  
6 overhead than the mailer of the Presort “clean” letter and would constitute  
7 a change in an important postal policy. The Commission confirmed its  
8 understanding of the current policy in its R2000-1 Opinion when it  
9 confirmed the use of BMM letters as the appropriate benchmark [at 5089]  
10 and stated:

11 This may mean that the institutional cost burden of First-Class  
12 workshare mail is increasing. However, when discounts pass  
13 through 100 percent of avoided costs to the workshare mailer, the  
14 contribution made by that mailer to institutional costs is the same as  
15 the mailer would have made without worksharing. Thus, workshare  
16 mailers and non-workshare mailers provide the same contribution,  
17 which is fair and equitable.<sup>6</sup>

18 Because of the de-linked rate design it has presented in this case, the  
19 Postal Service has not provided the calculations for comparing the cost of the  
20 presort pieces to the nearly identical non-presort benchmark BMM letter piece.  
21 However, the Postal Service’s de-linking can:

22 easily result in identical First Class letters making different  
23 contributions to overhead depending solely on whether or not the  
24 piece is workshared;

---

<sup>6</sup> *Opinion and Recommended Decision* R2000-1, at 5060, page 234 and 5089 at p. 241.

1 recommend rates that provide discounts that exceed the costs  
 2 saved by the Postal Service for the presorting and prebarcoding of  
 3 the letters; and  
 4 violate the policy of uniform rates for First Class letter mail.

5  
 6 Consequently, it is important to look at the results of the cost avoided  
 7 comparisons based on current policies and consider the rates that would result  
 8 from applying that concept.

9 **III. Findings and Recommended Rates**

10 Table 1 presents my calculations of costs avoided by the Postal Service  
 11 when compared to the bulk metered mail letter benchmark. The calculations  
 12 themselves will be discussed in Section IV of this testimony.

<b>Table 1: Workshare Related Unit Costs and Workshare Related Unit Cost Savings for First Class Letter Mail Compared with Proposed Discounts (cents per piece)</b>				
Letter category	Total Workshare Related Unit Cost	Total Workshare Related Unit Cost Savings	Proposed USPS Discounts from Single Piece Letter Rate R2006-1	Amount by Which USPS Proposed Discount differs from Unit Cost Savings
Bulk Metered Mail (BMM)	14.255			
Nonauto Presort	10.360	3.895	2.0	-1.89
Auto Mixed AADC	10.080	4.175	7.4	3.22
Auto AADC	8.871	5.384	8.5	3.12
3-Digit Presort	8.442	5.813	8.9	3.09
5-Digit Presort	6.960	7.296	10.8	3.50
Source: APWU-LR-1, "Letter Sum"				

13

1 The last column of Table 1 shows the amount by which the discounts for  
 2 Presort letters proposed by the Postal Service in this case differ from the costs  
 3 the Postal Service avoids due to the worksharing activities of the mailers. This  
 4 shows that the discounts proposed for most of the Presort letter categories in this  
 5 case are not justified by costs avoided.<sup>7</sup>

6 The first column of numbers in Table 2 shows what the rates would be if  
 7 the currently proposed Single Piece letter rate of 42 cents was used as a starting  
 8 point and then discounted by the costs avoided in Table 1 to produce rates for  
 9 each Presort letter rate category.<sup>8</sup>

10

<b>Table 2: Comparison of Single Piece and Presort First Class Letter Rates (cents per piece)</b>						
Letter Categories	Presort rates based on costs avoided (cents)	Percent increase from current rates	Current USPS proposal R2006-1 (cents)	Percent increase from current rates	Proposed rates based on partial adjustment (cents)	Percent increase from current rates
Single Piece	42.0	7.7%	42.0	7.7%	41.0	5.1%
Nonauto Presort	38.1	2.7%	40.0	7.8%	37.1	0.0%
Mixed AADC	37.8	16.0%	34.6	6.1%	35.1	7.7%
AADC	36.6	15.5%	33.5	5.7%	34.0	7.3%
3-digit	36.2	17.5%	33.1	7.5%	33.6	9.1%
5-digit	34.7	18.4%	31.2	6.5%	32.1	9.6%

<sup>7</sup> The one exception would be First Class Nonautomation Presort letters which have a higher calculated cost avoidance than its implied discount.

<sup>8</sup> This proposal follows the proposal of the Postal Service in this case to no longer have a separate rate for First Class Carrier Route Presort. That mail is assumed to migrate to the First Class 5-digit automation category.

1           The percentage increases that would result from these rate increases are  
2 shown in the next column of Table 2. Those can be compared to the Postal  
3 Service’s proposed rates and percentage changes shown in the middle columns  
4 of the table. To fully adjust the discounts to the costs avoided levels would  
5 require Presort rates to increase an additional 10 percentage points or more  
6 beyond the Postal Service’s current proposal.

7           In my opinion, the rates that would be achieved from such an adjustment  
8 are not a viable alternative for this case. With the costs avoided several cents  
9 out of alignment, a “one step” adjustment is likely to result in rate shock that  
10 probably would cause undue disruption to both mailers and the Postal Service.  
11 Additionally, raising the workshare rates by this amount, with no other  
12 adjustments, would exceed the revenue requirement in this case.

13           Consequently, the rates being proposed for the Commission’s  
14 consideration, shown in the next to last column of Table 2, show only a partial  
15 adjustment of the discounts toward the costs avoided levels but do keep the  
16 Presort letter rate increases down to single-digit levels; the remaining adjustment  
17 should be phased in during a subsequent proceeding or proceedings.

18           Any change in the Single Piece letter rate and in the relationships between  
19 the letter rates can have many impacts. The USPS proposal in this case already  
20 presents new Single Piece flat and parcel rates that are partially dependent on  
21 the Single Piece letter rate since they are calculated using costs avoided from  
22 the Single Piece letter first ounce rate. These are newly introduced flat and  
23 parcel rates and are in a transitional phase where the rates are not based on a

1 full pass through of costs differences. This provides a basis to change the  
2 relationships slightly.

3           Since the Single Piece letter rate has been lowered by 1 cent, the Single  
4 Piece flat has also been lowered by 1 cent to maintain the 20 cent differential  
5 between flats and letters that the Postal Service originally proposed in this case.  
6 The Single Piece parcel rate has been lowered by 5 cents. That was done mostly  
7 to mitigate the large rate shock that Single Piece parcel mailers will experience  
8 under the Postal Service's rate proposal. The First Class Presort flats rates have  
9 also been changed slightly, adding half a cent to each of the Postal Service's  
10 proposed rates. The Postal Service proposed a relatively small pass-through of  
11 the cost differentials between the Presort letter rates and the Presort flat rates, of  
12 around 40 percent.<sup>9</sup> An increase in the proposed Presort letter rates with no  
13 adjustment to the Presort flats rates would reduce the rate difference between  
14 them and reduce the cost pass through percentages to less than the Postal  
15 Service proposal. Thus, the proposed increase in the flats rate partially readjusts  
16 those pass-throughs. The First Class Mail Business Parcels rates were not  
17 changed from those proposed by the Postal Service even though the increase in  
18 the Presort letter rates also narrows the pass-throughs for those rates.

19           Changes in the First Class letter rates and the Presort letter discounts will  
20 have an impact on Standard mail volumes even though no changes in Standard  
21 rates are being proposed at this time. These changes in the rates will also have a

---

<sup>9</sup> APWU-T-32, p34. The Postal Service's Single Piece letter to flat rate differential represents approximately a 55 percent pass through of the cost differential (p.23).

1 minor impact on the volume of cards. All of these changes can result in  
2 differences in the revenues generated by each rate category when compared  
3 with the current Postal Service proposal.

4 The revenue impact of these changes has been estimated by using Mr.  
5 Thress' worksheets to estimate the volume impacts on all classes of mail from  
6 the proposed rate changes in First Class and then recalculating the resulting  
7 revenues for First Class and Standard based on the new proposed rates (if  
8 applicable) and the revised volumes generated from those rates.<sup>10</sup> The only  
9 changes made to Mr. Thress' worksheets were those required by the proposed  
10 changes in the First Class rates. That change in rates impacted First Class letter  
11 volumes, First Class card volumes, and Standard Regular volumes.<sup>11</sup> Priority,

---

<sup>10</sup> In the description of USPS LR-L-66, Mr. Thress describes the process for estimating new volumes using a different set of prices. The steps are to enter the new prices in the USPS LR-L-63 Prices.xls worksheet and then to copy selected portions of that worksheet to the LR-L-66 vf\_ar.xls worksheet. The new volumes for the test year can then be read from Attachment A of the latter workbook. These were the steps that were followed to determine the volume impacts of the proposed rate changes.

<sup>11</sup> Based on Mr. Thress' equations, there will be a smaller decline in the First Class Single Piece volumes (letters, flats and parcels combined) under this proposal than under the USPS rate proposal. There are some reasons to think Mr. Thress' equations may not provide an ideal forecast of Single Piece volumes by shape, in fact Mr. Thress does not produce separate forecasts of the three shapes. Mr. Taufique simply shares the Single Piece volumes out among Single Piece shape groups using the base year distribution. Those distributions were also used in predicting the volumes by shape in these calculations; however, the result may overstate the parcel and flat volumes that will result (under either the original USPS proposal or this revised proposal) since those two categories have much larger price increases than do letters. However, Mr. Thress does not calculate price elasticities for each of the three shapes, only for the three shapes combined so there is no alternative information on which to base alternative estimates of the Single Piece volume distribution by shape. Mr. Thress' equations also estimate a relatively large increase in nonauto presort mail because it will not experience any increase in price under this rate proposal, and

1 Express, Periodical, and Package volumes were not impacted by the change in  
2 First Class rates proposed here. The other assumptions that Mr. Thress used to  
3 produce his original after rates volumes have remained unchanged. Mr. Thress'  
4 original after rates GFY2008 volumes are shown in Appendix Table A-1 of this  
5 testimony where they are compared with the after rates GFY2008 volumes  
6 produced from the new rate assumptions described above.

7 Table 3 shows the changes in the revenues produced from the changes in  
8 volumes that are the result of the different rates. First Class Single Piece  
9 revenues are virtually unchanged. First Class cards revenues decline very  
10 slightly despite an increase in the cards volume produced by Mr. Thress'  
11 worksheets; that happens because the cards sent at letter rates produce less  
12 revenue due to the lower First Class Single Piece letter rate. The First Class  
13 Presort revenues increase slightly because an increase in the volume of  
14 Nonautomated Presort letters and flats offsets the volume declines experienced  
15 by the Automated Presort letters and flats. There is also a further shift from  
16 Single Piece to Presort parcels. Overall, revenues are virtually unchanged from  
17 the estimates made by Mr. Taufique in USPS LR-L-129 and by Mr. Kiefer in  
18 USPS LR-L-36.

19  
20

---

its price, relative to the other letters categories becomes more attractive. It is unclear that this category will react quite the way that Mr. Thress' equations anticipate given that this set of circumstances has not happened during the historical time period that has been used to estimate the coefficients. This may imply somewhat more uncertainty than usual surrounding some of the volume outcomes.

<b>Table 3: Comparison of Revenues Before and After Rate Change (Thousands of Dollars)</b>			
	TY Revenues After Rates as Calculated by USPS Witnesses	TY Revenues After Rates Based on Volumes from Proposed Rates	Percent Difference
First Class Single Piece Letters, Flats & Parcels	18,934,871	18,938,022	0.02%
First Class Presort Letters, Flats & Parcels	16,610,324	16,625,827	0.09%
First Class Cards	1,357,052	1,356,089	-0.07%
Standard Mail Regular	17,357,926	17,422,759	0.37%
Total of Listed Revenues	54,260,173	54,342,697	0.15%

Revised Revenues APWU-LR-2 (Includes the same Revenue adjustment factors used in the Postal Service witnesses' worksheets.)			

1 **IV. Calculation of Unit Costs**

2

3 To link together the Single Piece and Presort letter rates requires the

4 calculation of the costs avoided by the Postal Service. That requires calculating

5 the costs associated with the benchmark piece of mail. In every rate case since

6 the creation of Automation Presort rates during MC95-1, the benchmark piece

7 that has been used for this purpose is the First Class bulk metered mail letter

8 (BMM). There have been many discussions about the use of BMM as the

9 benchmark for cost avoided calculations. Some of those discussions have

10 revolved around which mail is most likely to convert to presort and others have

11 focused on the mail that presort mail would most likely convert back to if it left the

12 workshare category. Mr. Taufique, in his oral testimony, seemed to indicate that

13 part of his de-linking of the single piece rates from the workshared rates

14 stemmed from his perception that there has been a change in the type of mail

1 that is now converting to presort. This was not discussed in his written testimony  
2 and he provided no studies on this topic. However, it seems highly unlikely that  
3 the mail that is conver ting to presort mail is equivalent to the average collection  
4 mail that is coming from individual households, nonprofit organizations, and small  
5 businesses, which seems to be the concept that Mr. Taufique was suggesting to  
6 support his use of the Single Piece CRA as the base for his de-linked Single  
7 Piece calculations.<sup>12</sup>

8           Regardless, there is another reason for using the BMM letter as the  
9 benchmark. When looking at a very heterogeneous pool of mail, such as that of  
10 First Class letters, it is the only way to make certain that two mailers with  
11 identical pieces of mail are paying the same contribution to overhead costs,  
12 irrespective of whether they workshare. The Commission put this slightly  
13 differently in its R2000-1 Opinion, quoted earlier, when it stated “the contribution  
14 made by that mailer to institutional costs is the same as that mailer would have  
15 made without worksharing.”<sup>13</sup> Once worksharing discounts are introduced and  
16 mailers pay different rates based on their worksharing activities, it is necessary to  
17 make this comparison to determine if the letter rates are uniform across mailers.

18           In R2005-1 witness Abdirahman defined the benchmark piece: “BMM  
19 letters are generally considered to be machinable, homogeneous, non-barcoded  
20 pieces with machine printed addresses that are properly faced and entered in  
21 trays.”<sup>14</sup> The Postal Service has never directly calculated a cost for just this

---

<sup>12</sup> Tr. Vol. 16 at 4937.

<sup>13</sup> *Opinion and Recommended Decision R2000-1*, p. 234 at 5060.

<sup>14</sup> R2005-1, APWU/USPS-T21-8, R2005-1 Tr. Vol. 4 at 952.

1 benchmark piece. The unit costs for BMM letters must be approximated based  
2 on a broader category of letters, all First Class letter-shaped mail with metered  
3 postage.

4 The general steps followed by the Postal Service to calculate the unit cost  
5 savings between the benchmark piece and the presort pieces in previous cases  
6 were followed to produce the unit costs and cost savings shown in Table 1. The  
7 R2005-1 methodology (USPS version) of witness Eliane Van-Ty-Smith was  
8 followed to produce the costs by cost pools of all first class metered letter-shaped  
9 mail for the 2005 base period from the IOCS file provided in USPS LR-L-9.<sup>15</sup>  
10 Those costs by cost pool are adjusted to the test year and are converted into per  
11 unit costs for all First Class metered mail letters as per the methodology used by  
12 witness Marc Smith.<sup>16</sup>

13 These unit mail processing costs by shape and indicia, produced using  
14 witness Smith's methodology and confirmed by him, become the starting point for  
15 the First Class bulk metered mail letter proxy. From that starting point  
16 adjustments to the metered letter mail processing costs can be made to  
17 approximate the workshared-related unit mail processing costs for the bulk  
18 metered mailletter benchmark piece. Those adjustments follow the past practice  
19 of allocating each cost pool into one of three groupings: workshare-related  
20 proportional, workshare-related fixed, or non-workshare related. See Appendix  
21 Table A-2 and A-3 for the detailed cost pool allocations.

---

<sup>15</sup> Witness Van Ty Smith confirms these numbers in APWU/USPS-T11-2, Tr. Vol. 10 at 2446-2452.

<sup>16</sup> Witness Smith confirms these numbers in APWU/USPS-T13-2, Tr. Vol. 14 at 4222-4228.

1           In addition to making a calculation of unit costs for the benchmark piece,  
2 the distribution of the CRA totals for the First Class Presort letter mail produced  
3 by witness Abdirahman for this case must also be reconsidered. It is not  
4 possible to directly use the CRA cost allocations calculated by witness  
5 Abdirahman and shown in USPS LR-L-48 FCM.xls. That is because he allocates  
6 the cost pools into only two groups rather than the three used previously and he  
7 only uses mail processing costs in his final cost comparisons by rate category.  
8 The CRA totals for Presort letter mail must be reallocated to the same three  
9 groupings listed above and the distribution of the revised Presort workshare-  
10 related costs among the different rate classes of Presort letter mail recalculated.  
11 I have used the model costs provided by witness Abdirahman in USPS LR-L-48  
12 FCM.xls to distribute the presort mail processing costs among the different rate  
13 categories of Presort letter mail. The calculations are shown in APWU-LR-1.

14           In allocating the cost pools to the three groupings of cost categories:  
15 workshare-related proportional, workshare-related fixed, and non-workshare  
16 related, I have examined the allocations in the most recent three rate cases,  
17 R2000-1, R2001-1 and R2005-1. In its R2000-1 decision, the PRC relied on cost  
18 data produced from allocating 11 cost pools to the workshare -related proportional  
19 category, and 10 cost pools and one partial cost pool to the workshare-related  
20 fixed category. The remaining cost pools were allocated to the non-workshare  
21 related category.<sup>17</sup> Since that time, there have been changes to the cost pools

---

<sup>17</sup> In PRC-LR-9 from R2000-1, the following MODS cost pools were allocated to worksharing related proportional: BCS, OCR, LSM, MANL, LD15, LD41, LD42, LD43,LD44 and the NONMODS (Stations and branches) cost pools

1 produced by witness Van-Ty-Smith and they no longer exactly match the cost  
2 pools used in the R2000-1 decision.

3 The LSM cost pool has been discontinued since the letter-sorting  
4 machines have been taken out of service. Witness Van-Ty-Smith now combines  
5 the costs from LD41, LD42, LD43 and LD44 cost pools with the other station and  
6 branch data and does not produce separate MODS cost pools for those  
7 categories but does allocate those costs based on the allocation of the other  
8 station and branch data. The BCS cost pool has been renamed to BCS/DBCS.  
9 The workshare fixed category of 1BULKPR has been renamed 1PRESORT but  
10 witness Van-Ty-Smith states that the two cost pools have the same definition.<sup>18</sup>  
11 Consequently, it is still treated as a workshare fixed category. Abdirahman treats  
12 the other new categories 1TRAYSORT, 1DISPATCH, 1FLTPREP, and  
13 1OPTRANS as non-workshare related because they are not related to “piece  
14 distribution or package distribution of letters or cards.” 1TRAYSORT is a new  
15 cost pool introduced in FY2002 and is defined as mechanized tray sorter and  
16 robotics gantry. This is clearly not a piece distribution activity but since, by  
17 definition, the BMM is entered in trays and much of the Presort letter mail is  
18 entered in trays, there is some possibility that there are worksharing-related  
19 differences in these costs. Consequently, while I consider this a borderline case,

---

AUTO/MECH and MANL. The following cost pools were allocated to the worksharing-related fixed category: 1BULKPR, a third of 1CANCMMP, 1OPBULK, 1OPREF, 1PLATFRM, 1POUCHING, LD49, LD79, 1SUPP F1 and 1SUPP F4 and the NONMODS (Stations and branches) cost pool ALLIED. The remaining cost pools were allocated to the non-worksharing related category.

<sup>18</sup> See the response of Van-Ty-Smith to interrogatory TW/USPS-T11-9 in R2005-1 (May 5, 2005).

1 I did include it in the worksharing related fixed category. The others, following  
2 witness Abdirahman's practice, were allocated to non-workshare related. The  
3 cost pool 1CANCMMP, a third of which the PRC used in the fixed workshare-  
4 related category, was split after R2000-1 and became two cost pools: the  
5 cancellation activities and the meter prep activities (1CANCEL and 1MTRPREP).

6 In R2005-1, the two cost pools that resulted from the separation of  
7 1CANCMMP were both included, in full, in the workshare-related fixed  
8 category.<sup>19</sup> However, in R2000-1 the Postal Service did not include any of these  
9 activities in its original proposals and the PRC included only some of the  
10 activities (using an arbitrarily assigned valued of 1/3 of that cost pool in its final  
11 calculations). In these calculations the 1CANCEL has been placed in the non-  
12 workshare related category since the BMM letters skip the cancellation activities  
13 that non-metered, non-trayed mail would undergo and presort mail also skips the  
14 cancellation activities. While Postal witnesses Abdirahman and McCrery have  
15 both indicated that BMM goes straight to the MLOCs for barcoding, it is less  
16 clear that all the presort mail would skip the meter preparation operations.  
17 Consequently 1MTRPREP remains in the workshare fixed category.

18 In the past three rate cases, it has been the practice of the Postal Service  
19 to develop the cost basis for Nonautomation Presort letters separately from the  
20 costs for Automation Presort letters. However, in R2005-1, a problem with  
21 accurately dividing the costs between Nonautomation Presort and Automation  
22 Presort letters was identified. Consequently, the Postal Service has now

---

<sup>19</sup> LR-L-141 also includes the 1CANCEL cost pool in the workshare related category but is not clear as to why it is included there.

1 combined the costs for those two types of letters and reallocates the costs based  
2 on models for each category of presort mail. I have followed that methodology in  
3 my calculations. Thus, the per unit costs for all First Class Presort letter mail is  
4 used as the starting point for the Presort letter cost calculations. I have used the  
5 models provided by Mr. Abdirahman in his library reference USPS LR-L-48 to  
6 allocate the proportional costs to each of the different categories of Presort  
7 letters and then add on the fixed per unit worksharing related costs to each.

8         The unit delivery cost of BMM letters was proxied by the Nonautomation  
9 Presort letter unit delivery costs until the R2001-1 rate case. In that case witness  
10 Miller proposed changing the unit delivery cost to that of only machinable,  
11 Nonautomation Presort letters. That suggested change had merit since, by  
12 definition, BMM consists only of machinable letters and only machinable letters  
13 can be delivery point sequenced. However, in this case, the unit delivery costs of  
14 machinable Nonautomation Presort letters have not been calculated separately  
15 from the nonmachinable Nonautomation Presort letters. Consequently, the unit  
16 delivery costs of all Nonautomation Presort letters again has been used as the  
17 proxy for BMM unit delivery costs.<sup>20</sup>

18         The resulting unit cost calculations and the per unit savings they generate  
19 (which are also shown in Table 1) are presented in Table 4.

20

---

<sup>20</sup> Based on the volume distribution of the Nonautomation Presort letters in USPS LR-L-48 only about 1.3% of Nonautomation Presort letters are nonmachinable compared with the distribution in R2001-1 (USPS LR-J-60) when over 40% of the letters were considered to be nonmachinable.

**Table 4: R2006-1 FIRST-CLASS MAIL PRESORT LETTERS AND BMM LETTERS—SUMMARY (in cents)**

1 **V. Conclusion**

2  
3 The Postal Service has moved away from its long-followed methodology in this case,  
4 de-linking the rates of First Class Single Piece letters from rates of the First Class Presort  
5 letters. This testimony focuses on the policy change inherent in that methodological  
6 change and proposes rates that adhere to the policy that ties Presort First Class letter rates  
7 to those of Single-Piece First Class letter rates through costs avoided. Because of the  
8 significant possibility of rate shock if the full adjustment were to be implemented, the rates  
9 proposed here would be only a partial adjustment toward the policy of using costs avoided  
10 to calculate the First Class Presort letter rates. However, the problems inherent with not  
11 beginning this readjustment process are obvious. It will become harder and harder to return  
12 to the policy of a uniform First Class letter rate with 100 percent pass-throughs of costs  
13 avoided if the Single Piece and Presort letter rates are allowed to drift further apart.
