Direct Testimony of Michael K. Plunkett

AUTOBIOGRAPHICAL SKETCH

2	My name is Michael K. Plunkett. I am currently an economist in the
3	Pricing Office of Marketing. I began working for the Postal Service in 1984 as a
4	letter carrier at the Dracut, Massachusetts Post Office. In 1985, I transferred to
5	the Manchester, New Hampshire Division where I held a number of positions in
6	customer services operations. In 1990, I was accepted to the Management
7	Intern program. As an intern, I rotated through a number of short to medium
8	term assignments in various organizational units throughout the country. These
9	assignments included positions in headquarters, area, and district offices in
10	finance, human resources, operations, and marketing. In 1995, I transferred to
11	the office of Budget and Financial Analysis where I served as an Economist.
12	In February 1997, I transferred to the office of Pricing. My responsibilities
13	include all aspects of fee design for various special services.
14	I received bachelor's degrees in finance and economics from
15	Pennsylvania State University in University Park, Pennsylvania, and a master's
16	degree in business administration from the Wharton School at the University of
17	Pennsylvania, where I concentrated on finance and decision sciences.
18	I have presented pricing testimony in three previous dockets. I was the
19	Postal Service's pricing witness in the Provisional Packaging Service case

- (Docket No. MC97-5), and in the last omnibus rate case (Docket No. R97-1), for 1
- various special services. In addition, I presented pricing testimony in the original 2
- Mailing Online case (Docket No. MC98-1). 3

I. PURPOSE OF TESTIMONY

- My testimony presents pricing and classification analyses of the Postal 2
- Service's proposals to establish an experimental classification for Mailing Online. 3
- and an appropriate means for determining fees for the experiment. I then 4
- 5 explain how the proposals meet the rate and classification criteria of the Postal
- 6 Reorganization Act.

1

7

II. PROPOSAL

- The Postal Service proposes an experimental classification for Mailing 8
- Online. Mailing Online will allow customers who use the Postal Service's Internet 9
- 10 site (www.usps.com) to present electronic documents for printing and
- subsequent entry into the mail stream. Documents presented for Mailing Online 11
- 12 service will be stored electronically, commingled electronically with other
- 13 documents, and transmitted to one or more commercial printing companies who
- 14 will print and prepare the documents for entry at a designated postal acceptance
- unit. 15
- 16 The Postal Service plans to offer Mailing Online users the opportunity to
- use either First-Class Mail, Priority Mail, Express Mail or Standard Mail rates, 17
- depending on the content of the document and the individual customer's service 18
- 19 needs. Further, the Postal Service is developing a means for verifying a
- 20 Standard Nonprofit customer's eligibility, so that category can be available for
- experimental Mailing Online service. Before the conclusion of the experiment, 21
- customers will also have access to many special services currently available to 22
- senders of letter mail, for example, certificates of mailing, certified mail, and 23

return receipts. Customers who elect to use Priority Mail for their documents will

2 also be able to use Delivery Confirmation. In addition to choosing among these

subclass and special service alternatives, customers will also identify their

20

21

22

23

printing, finishing, and distribution preferences. These options and the estimated

prices for two typical Mailing Online documents are presented in my Exhibit E.

The Postal Service offered Mailing Online service first as a market test, which was originally posited as an initial step toward an experimental service that was to run for two years. Because changes in the Postal Service's Internet strategy rendered some of the Postal Service's cost testimony in the experimental proceeding inaccurate, the request for a recommended decision to conduct an experiment was withdrawn. The market test ended on October 29, 1999; however, development of a new version of Mailing Online software is ongoing. The Postal Service is now proposing a three-year experiment. Mailing Online is proposed as an independent special service that is treated as a separate product for pricing purposes. Mailing Online customers would be charged existing postage rates plus a fee for pre-mailing services.

In the market test of Mailing Online, the Postal Service proposed, and the Commission recommended, the establishment of a markup, which was applied to the actual printer costs as specified in the written contract between the Postal Service and the contractor providing pre-mailing services. Sound reasons support use of a markup as opposed to a fee schedule, the first being printer cost variations. The flexibility provided by a preset markup allows the Postal Service to signal customers correctly regarding the cost of printing. Printing

- 1 costs may vary substantially by region due to differences in labor, transportation,
- 2 and real estate costs. As growth of Mailing Online leads to the establishment of
- additional printing sites, the use of a markup allows the Postal Service to reflect 3
- local printing cost variations directly in the fees charged to Mailing Online
- customers. The flexibility afforded by the markup also provides the Postal 5
- Service and its customers with a mechanism whereby additional pre-mailing
- 7 services, such as new color or binding options, can be reflected equitably in
- Postal Service fees. The Commission recognized the necessity of this system in 8
- its market test Recommended Decision (Docket No. MC98-1, PRC Op. at 33), 9
- 10 and the Postal Service proposes adoption of a similar pricing structure in this
- 11 case.

12

III. PROJECTED FEE REVENUES

A. Premailing Revenue Estimation 13

- For the Postal Service, Mailing Online is an experimental entry into a 14
- market that has just begun to form. While it goes without saying that the Postal 15
- Service would not offer the service without the expectation that a significant 16
- number of customers would avail themselves of it, the ultimate size of the market 17
- for services like Mailing Online is unknown. In Docket No. MC98-1, Mailing 18
- Online volume and revenue forecasts were based on market research (Docket 19
- No. MC98-1, Tr. 2/429), and on the judgment of the Postal Service managers 20
- and analysts developing the product. 21
- In his testimony in this docket, witness Poellnitz (USPS-T-2) relies on 22
- these same estimates in developing unit costs. In the appendix to this testimony, 23

- I use the same forecast to estimate Mailing Online fee revenues. Revenue 1
- estimates are based on projected volumes, the costs presented by witness 2
- Poellnitz, and the proposed markup. The results are summarized below in 3
- Exhibit D.

5

18

19

B. MARKUP BASED PRICING

In the market test of Mailing Online, the Commission recommended the 6

Postal Service's proposal to employ a markup in determining fees for Mailing

Online. During the test, fees were set at 1.25 times the sum of the initial printer's 8

document production costs and a 0.1 cent charge per impression to cover 9

10 information technology costs. The advantages which led me to propose, and the

Commission to recommend, a markup approach are unchanged. Mailing Online 11

will continue to provide customers with myriad document preparation options, the

costs of which will vary by location and perhaps over time. The potential

complexity of a fixed fee schedule is a compelling reason for continued use of a

markup system, and although modified somewhat since the previous docket, I

once again propose a markup based system for setting Mailing Online fees. In

particular, my proposal recognizes that the proposed experiment will involve

more than one printer. I propose to apply the markup applied to the actual

printing costs for each job, independently of which printer(s) prepare a particular

job.1 20

The fee schedule in the market test (Docket No. MC98-1, PRC Op. Appendix 1, p. 2) specifies the Vestcom contract as the basis for fees.

C. FEE DESIGN

- 2 Practical application of the markup depends upon the costs used as the basis
- 3 for the markup. In this case I am attempting to satisfy two distinct goals:
- 4 compliance with the statutory criteria, and development of rates that will enhance
- 5 the Postal Service's ability to draw meaningful conclusions from the experiment.
- 6 The statutory criteria are examined below in a separate section; in this section I
- 7 confine my discussion to the latter.
- 8 The portion of Mailing online costs identified by witness Poellnitz as printer
- costs is determined by a series of contracts at different locations.² The contracts
- 10 will specify per unit prices for each element of a customer's mailing; these prices
- will in turn be marked up and passed on to Mailing Online customers. Witness 11
- Poellnitz's unit costs also include advertising costs, and information technology 12
- (IT) costs (developed in the testimony of witness Lim, USPS-T-3), which are 13
- distinct from those incurred by private printers. Witness Poellnitz has 14
- determined that most of these costs conform to witness Takis' definition of 15
- product-specific costs. For pricing purposes, I treat product-specific costs 16
- differently from volume variable costs. 17
- 18 The volume variable portion of IT costs, as presented by witnesses Lim and
- Poellnitz, constitute a recurring cost of providing Mailing Online service. 19
- Therefore, I treat these costs similarly to printer costs by adding a 0.1 cent per 20

² Contracts for the print sites are not yet available. Witness Poellnitz's testimony provides a proxy for the average printing charges that will apply during the experiment.

impression charge to printing impression charges before marking up the sum of 2 the two.3

The Postal Service typically seeks experimental classifications in order to 3 determine customer interest in a new product. Implicit in the decision to pursue 5 an experiment is the goal of collecting useful information on whether the service 6 in question warrants permanent inclusion in the DMCS. Therefore, it is important 7 to conduct the experiment under terms that are as close as practical to those 8 that will exist under a permanent classification, notwithstanding the potential for 9 experimental findings leading changes in the permanent service proposed. In the case of Mailing Online, this goal has specific rate design implications 10 because a significant portion of the information technology costs in witness Lim's 11 testimony are non-recurring product-specific costs.4 While we lack the historical 12 data necessary to produce a test year cost estimate for Mailing Online, I believe 13 it is safe to say that prospective test year costs would exclude a significant 14 portion of these costs. As a result, I exclude these costs when determining the 15 basis for a markup. 16 I do include these costs to perform an incremental cost test. In Exhibit D. 17

which summarizes experiment revenues and costs, I show that at the proposed fees. Mailing Online will produce sufficient revenues to cover the volume variable, as well as the product-specific costs of Mailing Online (Exhibit D, line 8).

³ The actual cost per unit is 64 thousandths of a cent in year 1.

18

19

⁴ The most notable example of such costs are the System Development & Implementation costs (USPS-T-3, p. 3). Nearly half of these costs are incurred prior to the experiment, and there is a marked decline in these costs in the third (continued...)

- I have also included pre-experiment costs in the incremental cost test. My 1
- 2 understanding is that these costs were expensed in the years during which they
- 3 were accrued. I further understand that, though such a treatment is consistent
- with generally accepted accounting principles (GAAP), one could argue that
- subsequent versions of Mailing Online constitute an asset with a depreciable 5
- 6 value, and that pre-experiment costs ought therefore to be capitalized. For the
- 7 reasons cited above. I do not view these costs as an appropriate basis for setting
- 8 fees. However, in performing an incremental cost test, rather than treating pre-
- 9 experiment costs as sunk - as would be consistent with traditional economic
- 10 analysis - I instead treat them as though they had been capitalized with a three
- vear amortization schedule. As a result, one third of the pre-experiment IT costs 11
- 12 are included in the incremental costs for each year of the experiment.
- I would also note that in line (9) of Exhibit D, the ratio of revenue to 13
- 14 incremental costs increases considerably from year one to year three. Though
- 15 this effect is readily apparent, it appears to be a feature of electronic products
- 16 generally that is, in the instant case, diminished by the relatively high cost of
- printing relative to information technology for Mailing Online. In general, 17
- 18 however, products that depend heavily on a supporting information technology
- 19 infrastructure are likely to exhibit a similar pattern: after an initial investment,
- marginal costs, and even average costs, decrease rapidly over time. 20

^{(...}continued) year of the experiment.

D. Markup/Cost Coverage

1

- In the market test of Mailing Online, a 25 percent markup was used. In its 2 Opinion on the market test the Commission agreed that the need to help a 3 4 "nascent service find its market and build volumes to the level that will support reasonable judgments about the nature of the market and the future viability of 5
- the service" (PRC Op., MC98-1, at 33) justified a markup of 25 percent. 6
- 7 However, the current proposal is different from that in the previous docket.
- For instance, IT start-up costs in this case are higher than those used in Docket 8
- No. MC98-1. Moreover, activation of print sites is scheduled to occur more 9
- rapidly than had originally been planned (USPS-T-1, §V). And as mentioned 10
- above, though sunk costs are typically ignored in determining the costs for 11
- markup, the Postal Service's product development plans call for recovery of pre-12
- experiment development costs. A higher markup will facilitate recovery of the 13
- development costs incurred for earlier versions of Mailing Online, while having a 14
- minimal impact on prices. 5 Based on my analysis of the statutory pricing criteria, 15
- I propose a pricing formula that includes a markup of 30 percent applied to unit 16
- printer costs and the variable portion of information technology costs. 17

E. Projected Revenues

18

19

20

21

Exhibit D shows projected revenues for Mailing Online based on the cost estimates provided by witness Poellnitz. At the proposed markup of 30 percent, Mailing Online is projected to produce \$458.9 million in fee revenues during the

⁵ Because the markup is applied only to the Mailing Online costs, a 5 percent change in markup has a much smaller effect on the total per piece charge (continued...)

- three-year experiment. The projected cost coverage of Mailing Online, consistent ì
- with the markup, is 130 percent. As Exhibit D also shows, fee revenues are 2
- sufficient to cover all of the incremental costs associated with the service. 3
- including pre-experiment costs if treated as capitalized. Moreover, at projected 4
- volumes, Mailing Online will contribute \$74.6 million to the Postal Service's 5
- institutional costs during the experiment, over and above my generous estimate 6
- of incremental costs. 7
- In addition to fee revenues, Mailing Online makes an indirect contribution 8
- to recovery of institutional costs through additional mail volume that accrues to 9
- the Postal Service through Mailing Online. As we stated in the last case, we 10
- expect 38 percent of Mailing Online volume to be new to the Postal Service. As 11
- indicated in Exhibit F, at projected volume levels and at basic automation rates, 12
- Mailing Online should produce \$100.9 million in additional First-Class Mail and 13
- Standard Mail (A) postage revenue during the experiment. Though these 14
- revenues are not explicitly included in calculating a cost coverage for Mailing 15
- 16 Online, they are an additional factor supporting the requested cost coverage.
- The market research on which Mailing Online volume projections are 17
- based assumed a limited availability of postal services through Mailing Online. 18
- The research survey respondents were asked to choose between two 19
- alternatives: First-Class Mail and Standard Mail (A). In its experimental form, 20
- Mailing Online will also allow customers to use Priority Mail and Express Mail, 21

^{(...}continued) including postage.

- 1 along with special services otherwise available to letter mail and Delivery
- 2 Confirmation for Priority Mail pieces. Because the market research contains no
- basis on which to project volumes for these products, I have made no explicit
- 4 adjustments to the volume projections to account for them. Because mail will be
- 5 entered near its destination, the service superiority typically offered by expedited
- 6 services is diminished. Since Priority Mail and Express Mail rates are
- 7 substantially higher than First-Class and Standard (A), we expect the majority of
- 8 users to forgo expedited services. However, the premium nature of expedited
- 9 services, and the expected availability of Delivery Confirmation, are reasons why
- substantial expedited volumes may develop. Similarly, the availability of special
- services with Mailing Online pieces provides no quantified basis for revising
- volume projections. To the extent that customers make use of expedited
- services and/or special services, the postage and fee revenue generated by
- Mailing Online will increase. However, because these revenues are not
- considered when determining the cost coverage of Mailing Online, they have no
- direct effect on the proposed markup and only underline why a low cost
- 17 coverage is appropriate.

IV. OTHER PRICING ISSUES

19 A. Postage Rates

- 20 During the market test of Mailing Online, customers paid automation basic
- rates for either First-Class Mail or Standard Mail (A). Mailing Online pieces will
- meet all of the necessary addressing and machineability requirements necessary
- to use automation rates. Moreover, at projected volumes Mailing Online pieces

- will achieve depth of sort that is, on average, much greater than required to
- 2 qualify for automation basic rates. For these reasons, the Postal Service
- 3 proposes that automation basic rates be made available for those classes with
- 4 the requisite discount structure, irrespective of the number of pieces in a given
- 5 transaction. Customers electing to use Priority Mail or Express Mail would pay
- the necessary single piece rates. While heavier weight Priority rates are zoned,
- 7 at current page limits Mailing Online pieces would pay unzoned rates.
- 8 Customers who elect to use special services would pay the existing special
- 9 service fee for whichever service they choose.
- As mentioned above, customers will be quoted a price, including postage,
- when they have finished specifying the features that they want for their
- document. The postage portion of the customer charges is calculated by the
- Mailing Online system based on the number of pages in the document, the
- 14 finishing options selected, and the type of envelopes used. Mailing Online
- printers will be required to use a specific grade of both paper and envelopes.
- thus ensuring uniformity. Based on standard unit weights for the physical
- components of a customer's mail piece, the Mailing Online system will calculate
- a weight per piece, and apply the appropriate rate given the subclass chosen by
- 19 a customer.

20

V. CLASSIFICATION CRITERIA

- 21 This proposal satisfies the classification criteria of section 3623 (c) of Title
- 22 39, United States Code, which requires that classification changes be set in
- 23 accordance with the following factors:

1 2	the establishment and maintenance of a fair and equitable classification system for all mail;
3 4 5 6	 the relative value to the people of the kinds of mail matter entered into the postal system and the desirability and justification for special classifications and services of mail;
7 8 9	 the importance of providing classifications with extremely high degrees of reliability and speed of delivery;
10 11 12	 the importance of providing classifications which do not require an extremely high degree of reliability and speed of delivery;
13 14 15	the desirability of special classifications from the point of view of both the user and the Postal Service; and
16 17 18	6. such factors as the Commission may deem appropriate.
19	By offering Mailing Online, the Postal Service provides customers the
20	opportunity to conduct transactions with the Postal Service without leaving their
21	home or workplace. It will also extend certain worsharing discounts to smaller
22	volume customers. As the Commission recognized in its market test Opinion,
23	Mailing Online is an example of the kind of innovative postal service envisioned
24	by the Act (PRC Op., at 34).
25	Mail entered via Mailing Online will have a high degree of reliability
26	(Criterion 3). For instance, all mail pieces sent via First-Class Mail or Standard
27	Mail (A) will be automation-compatible at the time of entry. Moreover, Postal
28	Service software used for Mailing Online will ensure that all Mailing Online
29	volume using these classes of mail is sorted in conformity with the most current
30	sort plans available, and with the greatest possible depth. To the extent that
31	Mailing Online pieces would have been mailed in the absence of the service, it is
32	expected that many or most such pieces would have been entered at single-

- piece rates by mailers who mail in relatively small quantities and who therefore
- 2 may not have the technical expertise to utilize the existing discount structure.
- 3 Consequently, Mailing Online should have a decidedly positive effect on the
- 4 overall classification system by enabling a large number of diverse customers to
- take advantage of worksharing opportunities and the postage discounts
- 6 associated therewith (Criterion 1). Mailing Online should also improve speed of
- 7 delivery due to the dispersed network of printers available to Mailing Online
- 8 customers. Moreover, Mailing Online should normally allow next day entry at, or
- 9 near, the point of destination, thereby providing Mailing Online customers faster
- delivery than they would otherwise be likely to receive. In addition, customers
- who wish to make use of the Postal Service's expedited services will now have
- 12 the opportunity to do so.
- Subject to existing content restrictions, customers who do not require
- immediate delivery can choose options that will enter pieces at Standard Mail (A)
- rates (Criterion 4). This will allow customers whose jobs meet the necessary
- content restrictions and who are less concerned with delivery speed an
- opportunity to save on postage expense, and will allow the Postal Service to
- improve the match of demand with processing capacity at the point of entry
- 19 (Criterion 5).
- The Postal Service has developed Mailing Online to meet the needs of
- small, independent businesses. In its historical role as a public service, the
- 22 Postal Service has long striven to provide mailing and communications services
- that meet the needs of individuals and small businesses. Since enactment of the

- Postal Reorganization Act, the Postal Service and the Postal Rate Commission
- 2 have worked together to develop products and price incentives that have allowed
- 3 larger mailers to reduce mailing costs by taking advantage of worksharing
- 4 opportunities. The concurrent growth of presorting and consolidation industries
- 5 have further allowed small and medium-sized businesses to share in the benefits
- 6 of worksharing. Mailing Online may also create a new market opportunity for
- 5 such premailing service providers to expand their customer base into the small
- 8 and home office (SOHO) market. Mailing Online thus both directly and indirectly
- 9 extends the benefits of presorting and automation to SOHO mailers. In addition
- to allowing individual, SOHO, and small nonprofit customers an easier means of
- accessing postal services, Mailing Online offers an opportunity for these
- customers, who might otherwise be unable to take advantage of worksharing, to
- reduce their mailing costs through a form of worksharing (Criterion 5).

VI. PRICING CRITERIA

- Mailing Online meets the criteria of section 3622 (b) of Title 39, United States Code, which requires that postal rates and fees be set in accordance with the following factors:
 - the establishment and maintenance of a fair and equitable schedule.
 - 2. the value of the mail service actually provided by each class or type of mail service to both the sender and the recipient;
 - the requirement that each class of mail or type of mail service bear the direct and indirect postal costs attributable to that class or type plus that portion of all other costs of the Postal Service reasonably assignable to such class or type;

27 28

14

15

16

17

18

19 20

21

22 23

24

25

1 2	4.	the effect of rate increases upon the general public; business mail users, and enterprises in the private sector of the
3 4		economy engaged in the delivery of mail matter other than letters;
5		ietters,
6	5.	the available alternative means of sending and receiving
7		letters and other mail matter at reasonable costs;
8 9	6.	the degree of preparation of mail for delivery into the postal
10	•	system performed by the mailer and its effect upon reducing
11		costs to the Postal Service;
12 13	7	simplicity of structure for the entire schedule and simple,
14	, ,	identifiable relationships between the rates or fees charged
15		for the various classes of mail for postal services;
16	0	the advectional cultural eciantific and informational value to
17 18	8.	the educational, cultural, scientific, and informational value to the recipient of mail matter; and
9		and resignant or man matter, and
20	9.	such other factors as the Commission deems appropriate.
21		
22	T	he Postal Service proposes that a markup of 130 percent be established
23	for Mailir	ng Online. The markup would be applied to the actual premailing costs
24	of each	customer's transaction, resulting in premailing fees that would vary
25	dependi	ng on the options selected by the customer. This markup guarantees
26	that Mail	ing Online will cover its variable costs and provide a contribution to
27	cover sta	art-up and institutional costs.
28	М	ailing Online enhances convenience. Its proposed cost coverage of 130
29	percent i	s reasonable and appropriate. Several factors weigh in favor of a
30	moderat	e cost coverage at this time. Mailing Online is being offered as an
31	experime	ental service, the purpose of the experiment being to determine the

viability of the product under conditions which are likely to obtain for a permanent

service. A relatively modest markup facilitates attainment of this particular goal

31

32

in a number of ways. The Postal Service's market research indicates that

2 Mailing Online's target customers are price sensitive (Docket No. MC98-1, LR-2

Table 16), and a relatively low markup during the introduction of the product will

4 help to build use among the target customers, thereby allowing the Postal

5 Service to determine salient factors such as customer satisfaction, and product

6 quality. In turn, this will improve the Postal Service's and the Commission's

abilities to evaluate the merits of Mailing Online in the event that the Postal

Service requests a permanent classification. Because the Mailing Online

experiment would be available for only three years, the Commission, the Postal

Service, and intervenors will have an opportunity to revisit fees soon, should the

Postal Service request a permanent classification. Moreover, the introduction of

Mailing Online will produce additional First-Class Mail, Standard Mail (A), Priority

Mail and Express Mail volume. Therefore, in addition to providing contribution

through its own markup, Mailing Online will indirectly improve postal finances to

the extent that the service attracts new volume to these subclasses, and to the

available special services. Finally, because Mailing Online mail will be entered

close to the point of destination while maximizing automation compatibility and

presortation, the cost to the Postal Service of handling these pieces will tend to

be lower than would otherwise be the case.

7

8

10

11

12

13

14

15

16

17

18

19

20

21

22

23

As mentioned above, Mailing Online is intended to serve small mailers by offering these customers a way to take advantage of worksharing opportunities.

While Mailing Online performs a service that is analogous in some respects to presorting, Mailing Online customers are unlikely to be current users of

- presorting services, because of the size of a typical Mailing Online mailing. As a
- 2 result, the effect of Mailing Online's introduction on existing presort volumes is
- 3 expected to be minimal. Since Mailing Online constitutes a new channel for
- 4 entering hard copy mail, it could increase use of mailing service organizations
- 5 much as presort, automation, and destination entry discounts already have.
- 6 Mailing Online leaves room for third party providers, should private companies
- 7 see the demand, by leaving room for deeper discounts than those available via
- 8 Mailing Online, and by creating the potential for service providers to assist
- 9 specific customers with creation of documents for submission via Mailing Online.
- The effect of Mailing Online on the general public, and on business mail users, is
- expected to be highly beneficial (Criterion 4). Mailing Online offers mail users
- the convenience of bundled mail preparation and mailing services that can be
- accessed from the desktop. Furthermore, with the Postal Service expecting
- ultimately to spend over \$170 million annually on printing services (see Exhibit
- 15 C), the introduction of Mailing Online will greatly benefit printing and document
- 16 preparation businesses.
- Application of Criterion 5 to Mailing Online is complicated since, with

 Mailing Online combining elements of both traditional and electronic mail,

 alternatives abound. Other postal administrations have found success with

 hybrid services. While domestic hybrid services do exist, none has yet

 demonstrated any ability to provide services comparable with Mailing Online by
- using a single web site that mixes customer jobs and then routes them for entry
- 23 near destinations. Mailing Online customers could elect to print and prepare

mailings themselves, at which point they would be able to use existing mail

2 classes consistent with their needs. There may be some difference in the rates

3 customers would pay. However, the difference in the total cost to the customer,

including preparation costs, defies precise quantification. Conversely, Mailing

5 Online customers, by virtue of their ability to access the Postal Service's web

site, are presumed to have access to electronic mail. To the extent that these

customers maintain electronic address lists of their customers, e-mail constitutes

a viable substitute for Mailing Online. Mailing Online may be preferable to e-mail

9 in enhancing the appearance or impact of a document.

As indicated above, the Postal Service proposes to charge automation basic rates for pieces sent via Mailing Online. Because the physical mail does not exist at the time customers submit their mailing, they cannot prepare the mail directly to meet the automation requirements. In order to qualify for Mailing Online, customers are required to meet a different set of standards. They must present a document and mailing list in a form that can be used by the Postal Service's online document batching system. Preparation of documents in this manner by customers allows the Postal Service to take advantage of economies of scale to lower printing costs, and, once enough printing companies are involved, to bypass handling costs at origin as a result of Mailing Online's entry of pieces closer to their destinations (Criterion 6).

Mailing Online makes use, where possible, of the Postal Service's existing rate schedules and, because it relies on a markup over actual costs, will not require fee changes as a result of changes in contract costs, or the rates for mail

- classes with which Mailing Online will be offered. Thus, the addition of Mailing
- 2 Online to the DMCS in the form proposed will in no way add unnecessary
- 3 complexity to the Postal Service's rate schedule (Criterion 7).

- 1. USPS-T-4, Table 12
- 2. Assumes that relative proportions of volume by paper size are constant for all document lengths. E.g. 78.9% of 5-6 page documents are on 8.5/11 paper.
- 3. Letters are assumed to be all documents less than 7 pages in length.
- 4. For the purposes of estimating volume by ounce increment, the following paper and envelope weights are assumed.

8.5"X11" = 0.2 oz.

8.5"X14" = 0.254 oz.

11"X17" = 0.4 oz.

#10 Envelope = 0.2 oz.

Flat Envelope = 0.4 oz.

- 5. Revenue = Total Volume X Rate. Assumes rates after implementation of Docket No. R97-1.
- 6. New revenue = 0.38 X Revenue (LR-1/MC98-1, p.)
- 7. Existing Volume = 0.62 X Total (ibid.)
- 8 Existing rates assume that customers would have paid the highest applicable rate for their mail pieces. For instance, customers sending First-class pieces are assumed to have paid the
- 9. Rate differential is the difference between the applicable and existing rates.
- 10. Revenue leakage = Rate differential X Existing volume

- 1. USPS-T-4, Table 12
- 2. Assumes that relative proportions of volume by paper size are constant for all document lengths. E.g. 78.9% of 5-6 page documents are on 8.5/11 paper.
- Letters are assumed to be all documents less than 7 pages in length.
 For the purposes of estimating volume by ounce increment, the following paper and envelope weights are assumed.

8.5"X11" = 0.2 oz.

8.5"X14" = 0.254 oz.

11"X17" = 0.4 oz.

#10 Envelope = 0.2 oz.

Flat Envelope = 0.4 oz.

- 5. Revenue = Total Volume X Rate. Assumes rates after implementation of Docket No. R97-1
- 6. New revenue = 0.38 X Revenue (LR-1/MC98-1, p.)
- 7. Existing Volume = 0.62 X Total (ibid.)
- 8. Existing rates assume that customers would have paid the highest applicable rate for their mail pieces. For instance, customers sending First-class pieces are assumed to have paid the
- 9. Rate differential is the difference between the applicable and existing rates.
- 10. Revenue leakage = Rate differential X Existing volume
