USPS Proposed Internal Service Performance Measurement System Data
For Quarter 4 of Fiscal Year 2016

Overview

This Category 2 library reference consists of service performance data generated by the proposed internal Service Performance Measurement (SPM) system for Quarter 4 of Fiscal Year 2016. It also includes a report summarizing observations on the operation of the system. The Postal Service collected data from 23.3 billion mailpieces in Q4. The Postal Service continues to employ design and software enhancements to improve the accuracy of sampling results for internal SPM.

It is important to remember that there are substantive differences between Internal SPM and the current external measurement system. Therefore, there is no expectation that the service scores can or will be identical for each product between the two systems. For example, the current EXFC system uses a comparatively small sample of test mailpieces which are measured from mail deposit to delivery, using independent contractors to start-the-clock (mail dropped) and reporters to stop-the-clock (mail received). However, measurement of Single-Piece First-Class Mail through Internal SPM uses all eligible mail processed on automation equipment to measure the Processing Duration, and samples of live mail at collection and delivery points performed by postal employees to measure First Mile (collection) and Last Mile (delivery) performance. These data are combined to measure overall transit time in Internal SPM. The measurement methodology differences will likely result in differences in performance estimates between the two systems. Neither system is measuring every piece of mail from collection to delivery; thus, estimates from both are subject to error, some of which is due to sampling and some due to non-sampling.

Contents

The Q4 report and accompanying summary of observations is contained in a separate Excel workbook designated as follows:

**FY 2016 Q4 (164):**

1. FC Flats 164 Scores Report.xls
2. FC Flats 164 Variance Report.xls
3. Package-BPMF 164 Scores Report.xls
4. Package-BPMF 164 Variance Report.xls
5. Periodicals 164 Score Report.xls
6. Periodicals 164 Variance Report.xls
7. PrstFC LC 164 Scores Report.xls
8. PrstFC LC 164 Variance Report.xls
9. SPFC LC 164 Scores Report.xls
10. SPFC LC 164 Variance Report.xls
11. Standard Mail-Carrier Route 164 Scores Report.xls
12. Standard Mail-Carrier Route 164 Variance Report.xls
15. Standard Mail-Flats 164 Scores Report.xls
17. Standard Mail-High Density and Saturation Flats 164 Scores Report.xls

50% of the district scores were within 0.5% for Q4.
An improvement of 0.3% over Q3.
Internal SPM aligned closer to Legacy for both Periodicals and BPM Flats

Note: Negative differences occur when Internal SPM results are lower than Legacy SPM results.
4 out of 7 areas were within 1.8% for Q4. A decrease of 0.4% compared to Q3.
50% of the district scores were within 1% for Q4. An improvement of 0.4% over Q3.
Applies to all products except EDDM
- Last mile profiles were unweighted, differing from the statistical design
- The methodology used for calculating last mile profile in the Legacy system (last processing operation) differed from the methodology used in Internal SPM (days left level).

Applies to all products except EDDM, SPFC Letters/Cards, and Presort First-Class Letters/Cards
- The methodology used to produce Q4 margins of error deviated from the statistical design. The deviation is due to a known software defect in the overall originating/destinating variance calculation identified during testing that was not resolved prior to the reporting deadline, impacting a small portion of the calculations. Additional development and testing will occur in FY17 Q1 to resolve the margins of error calculations.

Applies to Single-Piece First-Class Mail Only
- The methodology used to calculate First Mile profiles was modified from the statistical design. As a result of very limited sampling data available for one first processing operation type, all mailpieces were categorized into one group for Q4 reporting. Additional analysis is ongoing for methodology updates in FY17 Q1.
- Some technical issues with identifying, tracking, and measuring unique mailpieces through automation based on processing scans existed this quarter. Additional validations will be undertaken to confirm that issues have been resolved in Q1 FY17.
- This report includes performance estimates with First Mile profiles based entirely on collection mail and does not include mail sent over retail counters. The system capability to include the retail mail, which will be measured using First-Class Mail with Special Services requested, into the First Mile estimates is under development and testing. Completion is anticipated for FY17 Q1.
- Sampling for most high-volume courtesy and business reply mail delivery points was not enabled during the quarter, and there was very limited representation of the reply mail portion of Single-Piece First-Class Mail™ letters/postcards in the Last Mile sample. Due to the very limited data available to measure the overall transit time for this mail, all of the courtesy and business reply mail were excluded from these results.
- Challenges with sampling Single-Piece First-Class Flats at collection resulted in limited data available for estimating First Mile Profile for flats across the quarter in all districts, impacting the reliability of the estimates.
- The observed First Mile Impact for Single-Piece First-Class Mail flats results is higher than expected, resulting in lower on-time performance scores. The combination of very few pieces sampled in collection and gaps in business rules for unique piece identification and measurement are the most significant root causes.
